

Final is **not** cumulative! Covers this material and onward.

Chapter 5 - Limits and Continuity

5.1.1: Definition (Limits of Functions)

Let: $D \subset \mathbb{R}$, $f : D \rightarrow \mathbb{R}$, and $c \in D'$ (i.e. c is an accumulation point)

We say that $L \in \mathbb{R}$ is a **limit** of f at c if, $\forall \epsilon > 0$, $\exists \delta(\epsilon) > 0$ st when $x \in D$ and $0 < |x - c| < \delta$, then

$$|f(x) - L| < \epsilon$$

(i.e. the limit as x goes to c of $f(x) = L$)

$$x \pm c$$

$$-\delta < x - c < \delta$$

$$c - \delta < x < c + \delta$$

Recall the definition of a limit:

$$f(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$$

where x is fixed.

Theorem 5.1.2

Let: $f : D \rightarrow \mathbb{R}$, $c \in D'$

Then:

The limit $x \rightarrow c$ of $f(x) = L$ exists iff for each neighborhood V of L , \exists a deleted neighborhood U of c st $f(U \cap D) \subset V$.

Proof.

\rightarrow

Suppose $\lim_{x \rightarrow c} f(x) = L$.

Then,

for each neighborhood V of L (i.e. for each $\epsilon > 0$, $V = N(L, \epsilon)$), \exists a deleted neighborhood U of c (i.e. $\exists \delta(\epsilon) > 0$ st $N^*(c, \delta) = U$)

st $f(U \cap D) \subset V$

\leftarrow

The converse is similar.

Remember: definitions are iff

□

Example 5.1.3

Let: $k \in \mathbb{R}$

Define $f : \mathbb{R} \rightarrow \mathbb{R}$ by $f(x) = k$, $\forall x \in \mathbb{R}$

Let $c \in \mathbb{R}$

Show that $\lim_{x \rightarrow c} f(x) = k$

Solution:

For each $\epsilon > 0$,

$$|f(x) - k| = |k - k| = 0 < \epsilon$$

whenever $0 < |x - c| < \epsilon$

Example 5.1.4

Confirm that $\lim_{x \rightarrow c} f(x) = c$ for the function $f(x) = x$, where $c \in \mathbb{R}$ and $f : \mathbb{R} \rightarrow \mathbb{R}$

Solution:

For each $\epsilon > 0$,

$$|f(x) - c| = |x - c| < \epsilon$$

whenever $0 < |x - c| < \delta = \epsilon$

Theorem 5.1.8

Let: $f : D \rightarrow \mathbb{R}$, $c \in D'$

Then,

$\lim_{x \rightarrow c} f(x) = L$ iff for **every** sequence $\{s_n\}$ in D st $s_n \neq c$, $\forall n \in \mathbb{N}$ and $\lim_{n \rightarrow \infty} s_n = c$,

it follows that the sequence $\{f(s_n)\}$ converges to L .

(i.e. the values of s_n eventually get within a δ neighborhood of c)

Proof.

\rightarrow

Assume: $\lim_{x \rightarrow c} f(x) = L$

Let: $\{s_n\}$ be a sequence in D st $s_n \neq c \forall n \in \mathbb{N}$ and $\lim_{n \rightarrow \infty} s_n = c$

Want to show: $\lim_{n \rightarrow \infty} f(s_n) = L$

Now, $\forall \epsilon > 0$, $\exists \delta(\epsilon) > 0$ st

$$|f(x) - L| < \epsilon \tag{1}$$

whenever $0 < |x - c| < \delta$ **and** $x \in D$ (we need this part so that $|f(x) - L|$ makes sense).

I'd like to know that $|f(s_n) - L|$ gets close to 0, so:

Since $\lim_{n \rightarrow \infty} s_n = c$, $\exists N \in \mathbb{N}$ st

$$0 < |s_n - c| < \delta \tag{2}$$

for $n \geq N$

From (1) and (2),

$$|f(s_n) - L| < \epsilon$$

for $n \geq N$

(if we think of $f(s_n)$ as our t_n , where $t_n \rightarrow L$ as $n \rightarrow \infty$)

By definition,

$$\lim_{n \rightarrow \infty} f(s_n) = L$$

←

Conversely, using the contrapositive,

Assume: $\lim_{x \rightarrow c} f(x)$ does not exist.

Side Note

Negating that:

$\exists L \in \mathbb{R}$ st

$\lim_{x \rightarrow c} f(x) = L$

$\forall \epsilon > 0, \exists \delta > 0$ st

$\forall x$ st $0 < |x - c| < \delta$,

$|f(x) - L| < \epsilon$

Thus,

for each $L \in \mathbb{R}$, $\exists \epsilon_0 > 0$ st

$\forall \delta > 0, \exists x$ st $0 < |x - c| < \delta$ st

$$|f(x) - L| \geq \epsilon_0$$

Side Note

First we proved $p \Rightarrow q$.

Now we're going to prove $q \Rightarrow p$ by proving:

not $p \Rightarrow$ not q

Want to show: \exists a sequence $\{s_n\}$ in D st $s_n \neq c, \forall n \in \mathbb{N}$ and $\lim_{n \rightarrow \infty} s_n = c$

but, $\{f(s_n)\}$ to fail to converge to L .

Let: $\delta_n = \frac{1}{n}$

Now, for each $n \in \mathbb{N}$, $\exists s_n \in D$ st

$$0 < |s_n - c| < \frac{1}{n} \text{ and } |f(s_n) - L| \geq \epsilon_0 \quad (3)$$

Notice that $s_n \neq c, \forall n \in \mathbb{N}$ and $\lim_{n \rightarrow \infty} s_n = c$.

Side Note

Is $\lim_{n \rightarrow \infty} f(s_n) = L$?

For $\epsilon = \frac{\epsilon_0}{2} > 0$,

$\exists N \in \mathbb{N}$ st

$$|f(s_n) - L| < \frac{\epsilon_0}{2}$$

for $n \geq N$

So, no. $\lim_{n \rightarrow \infty} f(s_n) \neq L$

From **(3)**, $\lim_{n \rightarrow \infty} f(s_n) \neq L$

(page 166, Theorem 4.1.8 says

$|s_n - s| \leq k|a_n|$ for $n \geq N$

and

if $\lim_{n \rightarrow \infty} a_n = 0$, then $\lim_{n \rightarrow \infty} s_n = s$)

□
