## Chapter 4: Model Testing

$$\text{Properties of residuals: mean } 0, MS_{res} = \sum_{i=1}^n \frac{(\epsilon_i - \bar{\epsilon})^2}{n-p} = \sum_{i=1}^n \frac{\epsilon_i^2}{n-p} = \frac{SS_{res}}{n-p}$$

$$\text{Scaling Residuals: Standardized Residuals: } d_i = \frac{\epsilon_i}{\sqrt{MS_{res}}} \text{ Studentized: } r_i = \frac{\epsilon_i}{\sqrt{MS_{res}(1 - h_{ii})}}, \mathbf{V}[\epsilon_i] = \sigma^2(1 - h_{ii}), \mathbf{cov}(\epsilon_i, \epsilon_j) = -\sigma^2 h_{ij}$$

Other model testing: plot  $x_i$  and  $x_j$ : linear rln means high corr.

Formal test for lack of fit: Assuming everything is tested and ideal, to test for linearity, we use:  $SS_{res} = SS_{PE} + SS_{LOF}$

$$F_0 = \frac{SS_{LOF}/(m-2)}{SS_{PE}/(n-m)} = \frac{MS_{LOF}}{MS_{PE}} \quad \mathbf{E}[MS_{LOF}] = \mathbf{E}[MS_{PE}] = \sigma^2, \text{ where } m \text{ is num regressors, } n \text{ is num samples} \quad \mathbf{V}[\bar{y}] = \frac{p\sigma^2}{n} \text{ (indpure e)}$$
