1. Prove Pascal's Formula $\binom{\alpha}{k} = \binom{\alpha-1}{k-1} + \binom{\alpha-1}{k}$ for any $\alpha \in \mathbb{R}$ and $k \in \mathbb{Z}_{\geq 0}$. (Note: You will need to use the falling factorial definition.)

$$\begin{pmatrix} \alpha \\ k \end{pmatrix} = \begin{pmatrix} \alpha - 1 \\ k - 1 \end{pmatrix} + \begin{pmatrix} \alpha - 1 \\ k \end{pmatrix}$$

$$= \frac{(\alpha - 1)!}{((\alpha - 1) - (k - 1))!(k - 1)!} + \frac{(\alpha - 1)!}{((\alpha - 1) - k)!k!}$$

$$= \frac{(\alpha - 1)!}{(\alpha - k)!(k - 1)!} + \frac{(\alpha - 1)!}{(\alpha - 1 - k)!k!}$$

$$= \frac{(\alpha - 1)!}{(\alpha - k)!(k - 1)!} + \frac{(\alpha - 1)!(\alpha - k)\frac{1}{k}}{(\alpha - k)!(k - 1)!}$$

$$= \frac{(\alpha - 1)! + (\alpha - 1)!(\alpha - k)\frac{1}{k}}{(\alpha - k)!(k - 1)!}$$

$$= \frac{k(\alpha - 1)! + (\alpha - 1)!(\alpha - k)}{(\alpha - k)!k!}$$

$$= \frac{\alpha(\alpha - 1)!}{(\alpha - k)!k!}$$

$$= \frac{\alpha!}{(\alpha - k)!k!}$$

2. Determine the generating function for each of the following sequences:

a.
$$1, r, r^2, r^3, ...$$

 $1 + rx + r^2x^2 ... \longrightarrow \frac{1}{1-rx}$
b. $1, -1, 1, -1, ...$
 $1 - x + x^2 - x^3 \longrightarrow \frac{1}{1+x}$
c. $\binom{\alpha}{0}, -\binom{\alpha}{1}, \binom{\alpha}{2}, -\binom{\alpha}{3}, ...$
 $\binom{\alpha}{0} - \binom{\alpha}{1}x + \binom{\alpha}{2}x^2 - \binom{\alpha}{3}x^3 ...$
 $1 - \alpha x + \frac{\alpha(\alpha-1)}{2*1}x^2 - \frac{\alpha(\alpha-1)(\alpha-2)}{3*2*1}x^3 ...$
 $1 - \alpha x + \frac{[\alpha]_{(2)}}{[2]_{(2)}}x^2 - \frac{[\alpha]_{(3)}}{[3]_{(3)}}x^3 ...$
 $\sum_{k=0}^{\infty} (-1)^k \binom{\alpha}{k} x^k$
 $(1-x)^{\alpha}$
d. $1, \frac{1}{1!}, \frac{1}{2!}, \frac{1}{3!}, ...$
 $1 + \frac{1}{1!}x + \frac{1}{2!}x^2 + \frac{1}{3!}x^3 ...$
 e^x
e. $1, \frac{-1}{1!}, \frac{1}{2!}, \frac{-1}{3!}, \frac{1}{4!}, ...$
 $1 - \frac{1}{1!}x + \frac{1}{2!}x^2 - \frac{1}{3!}x^3 ...$
 e^x
f. $\binom{0}{2}, \binom{1}{2}, \binom{2}{2}, \binom{2}{2}, \binom{3}{2}, ...$
 $\binom{0}{2} + \binom{1}{2}x + \binom{2}{2}x^2 + \binom{3}{2}(2)x^3 ...$
 $-\frac{1}{2} + 0x + \frac{[2]_{(2)}}{[2]_{(2)}}x^2 + \frac{[3]_{(2)}}{[2]_{(2)}}x^3 ...$

Is this the right process? How do you know when to use EGF vs GF?

- 3. Given the Fibonacci sequence $f_n = f_{n-1} + f_{n-2}$ with initial conditions $f_0 = 0$ and $f_1 = 1$,
 - a. Solve the recursion by writing it as a linear homogenous recursion and finding the characteristic polynomial. Write your answer in the form $c_1q_1^n + c_2q_2^n$. (Note: we have already solved this up to finding the constants in class. Finish the problem.)

$$f_n = f_{n-1} + f_{n-2}$$

$$0 = f_n - f_{n-1} - f_{n-2}$$

$$q^n - q^{n-1} - q^{n-2} = 0$$

$$q^{n-2}(q^2 - q^1 - 1) = 0$$

Thus, the solution has the form $f_n = c_1(?)^n c_2(?)^n$.

$$q = \frac{1 \pm \sqrt{5}}{2}$$

$$f = e^{-1 + \sqrt{5}}$$

$$f_n = c_1 \frac{1 + \sqrt{5}}{2} + c_2 \frac{1 - \sqrt{5}}{2}$$

$$f_0 = c_1 + c_2$$

$$f_1 = c_1(\frac{1+\sqrt{5}}{2})^1 + c_2(\frac{1-\sqrt{5}}{2})^1$$

Let
$$f_0 = 0$$
, $f_1 = 1$. Solving for c_1 and c_2 gives us $c_1 = \frac{1}{\sqrt{5}}$, $c_2 = \frac{-1}{\sqrt{5}}$

Thus,
$$f_n = \frac{1}{\sqrt{5}} (\frac{1+\sqrt{5}}{2})^n + \frac{-1}{\sqrt{5}} (\frac{1-\sqrt{5}}{2})^n$$

b. Solve the recursion by using generating functions. (Note: Use a partial fraction decomposition to finish the problem.)

$$f_n = f_{n-1} + f_{n-2}$$

$$\mathbf{h}_n = \mathbf{h}_{n-1} + \mathbf{h}_{n-2}$$

$$0 = h_n - h_{n-1} - h_{n-2}$$

Let
$$g(x) = h_0 + h_1 x^1 + h_2 x^2 \dots$$

Then,

$$g(x) = h_0 + h_1 x^1 + h_2 x^2 \dots$$
$$-xg(x) = -h_0 x^1 - h_1 x^2 - h_2 x^3 \dots$$
$$-x^2 g(x) = -h_0 x^2 - h_1 x^3 - h_2 x^4 \dots$$

Thus,

$$(1 - x - x^2)g(x) = h_0 + (h_1 - h_0)x^1 + (h_2 - h_1 - h_0)x^2 + (h_3 - h_2 - h_1)x^3 + \dots$$

But since $0 = h_n - h_{n-1} - h_{n-2}$,

$$(1 - x - x^{2})g(x) = h_{0} + (h_{1} - h_{0})x^{1}$$
$$g(x) = \frac{h_{0} + (h_{1} - h_{0})x}{(1 - x - x^{2})}$$

Plugging in $h_0 = 0$ and $h_1 = 1$,

$$g(x) = \frac{x}{(1 - x - x^2)}$$

$$g(x) = \frac{x}{(1 - x - x^2)}$$

$$g(x) = \frac{x}{(x + (-\frac{1}{2} + \frac{\sqrt{5}}{2})(x - (-\frac{1}{2} + \frac{\sqrt{5}}{2}))}$$

$$g(x) = \frac{A}{(x + (-\frac{1}{2} + \frac{\sqrt{5}}{2})} + \frac{B}{(x - (-\frac{1}{2} + \frac{\sqrt{5}}{2}))}$$

$$g(x) = \frac{1/2}{(x + (-\frac{1}{2} + \frac{\sqrt{5}}{2}))} + \frac{1/2}{(x - (-\frac{1}{2} + \frac{\sqrt{5}}{2}))}$$

$$g(x) = \frac{1}{2(x + (-\frac{1}{2} + \frac{\sqrt{5}}{2}))} + \frac{1}{2(x - (-\frac{1}{2} + \frac{\sqrt{5}}{2}))}$$

$$g(x) = \frac{1}{2} \frac{1}{((-\frac{1}{2} + \frac{\sqrt{5}}{2}) + x)} - \frac{1}{2} \frac{1}{((-\frac{1}{2} + \frac{\sqrt{5}}{2}) - x)}$$

At this point, I'm not sure how to convert to Power Series $f_n=\frac{1}{\sqrt{5}}(\frac{1+\sqrt{5}}{2})^n+\frac{-1}{\sqrt{5}}(\frac{1-\sqrt{5}}{2})^n$

4. Prove that the Fibonacci number f_n is even if, and only if, divisible by 3.

Wait.. 2 is a fibonacci number that is even and not divisible by 3.. So is 8.

Assume: f_n is even (i.e. $\exists t \in \mathbb{Z}$ such that $f_n = 2t$)

 \leftarrow

Assume: 3 divides f_n (i.e. $\exists t \in \mathbb{Z}$ such that $f_n = 3t$)

- 5. Consider a 1-by-n chessboard. Suppose we color each square of the chessboard with one of the colors red, white, or blue. Let h_n be the number of colorings in which there is an even number of red squares (the example from class).
 - a. Reproduce the exponential generating function solution from class.

Colors: R, W, B. R is even.

EGF:

$$(1 + \frac{x^2}{2!} + \frac{x^4}{4!}...)(1 + \frac{x^1}{1!} + \frac{x^2}{2!}...)^2$$

$$\frac{1}{2}(e^x + e^{-x})e^x e^x$$

$$\frac{1}{2}(e^{3x} + e^x)$$

$$\frac{1}{2}(\sum \frac{3^n x^n}{n!} + \sum \frac{x^n}{n!})$$

$$\frac{1}{2}(\sum (3^n + 1)\frac{x^n}{n!})$$

$$\Rightarrow \sum (\frac{3^n + 1}{2})\frac{x^n}{n!}$$

b. Solve this by using a standard generating function and partial fractions.

GF:

$$(1+x^2+x^4...)(1+x+x^2...)^2$$

$$\frac{1}{1-x^2}\frac{1}{1-x}\frac{1}{1-x}$$

$$\frac{1}{(1+x)(1-x)^3}$$

$$\frac{A}{1+x}+\frac{B}{1-x}+\frac{C}{(1-x)^2}+\frac{D}{(1-x)^3}$$

After partial fractions:

How do I get from above to below?

$$\sum (\frac{3^n+1}{2})x^n$$

- c. Reproduce the associated recursion for h_n .
- d. Using your answer from part c, solve the recursion using the generating function method for non-homogeneous recursions.
- 6. Consider a 1-by-n chessboard. Suppose we color each square of the chessboard with one of the colors red or blue. Let h_n be the number of colorings in which no two squares that are colored red are adjacent. Find a recurrence relation that h_n satisfies, then derive a formula for h_n .

Colors: R, B.

 h_n is the number of colorings such that no two adjacent squares are red.

In other words, $B \Rightarrow R$ or B and $R \Rightarrow B$.

$$h_1 = 2, h_2 = 3, h_3 = 5, h_4 = 8, h_5 = 13...$$

It looks like the number of ways that color the nth square blue is just h_{n-1} , and the number of ways to color the nth square red is the number of ways that color the (n-1)th square blue, which is just h_{n-2} .

So it looks like a recurrence relation would be $h_n = h_{n-1} + h_{n-2}$

Since this is Fibonacci (and we already did this):

$$h_n = \frac{1}{\sqrt{5}} \left(\frac{1+\sqrt{5}}{2} \right)^n + \frac{-1}{\sqrt{5}} \left(\frac{1-\sqrt{5}}{2} \right)^n$$

7. Determine the generating function for the number h_n of bags of fruit of apples, oranges, bananas, and pears in which apples % 2 = 0, oranges \le 2, bananas % 3 = 0, and pears \le 1. Then find a formula for h_n from the generating function.

GF:

$$(1+x^{2}+x^{4}+...)(1+x+x^{2})(1+x^{3}+x^{6}...)(1+x)$$

$$\frac{1}{(1-x)^{2}} \frac{1-x^{3}}{1-x} \frac{1}{(1-x)^{3}} \frac{1-x^{2}}{1-x}$$

$$\frac{1}{(1+x)(1-x)} \frac{(1-x)(1+x+x^{2})}{1-x} \frac{1}{(1-x)^{3}} \frac{(1-x)(1+x)}{1-x}$$

$$\frac{(1+x+x^{2})}{(1-x)^{4}}$$

$$\frac{1}{(1-x)^{2}} + \frac{-3}{(1-x)^{3}} + \frac{3}{(1-x)^{4}}$$

$$\sum x^{2n} - 3\sum x^{3n} + 3\sum x^{4n} \longrightarrow \sum x^{2n} - 3x^{3n} + 3x^{4n}$$

- 8. Determine the exponential generating function for the following sequence:
 - a. 0!, 1!, 2!, ...

$$g^{(e)}(x) = \frac{0!}{0!} + \frac{1!}{1!}x + \frac{2!}{2!}x^2 \dots$$
$$g^{(e)}(x) = 1 + x + x^2 \dots$$

b. $[\alpha]_{(\underline{0})}$, $[\alpha]_{(\underline{1})}$, $[\alpha]_{(\underline{2})}$, $[\alpha]_{(\underline{3})}$, ... (Note: $[\alpha]_{(\underline{n})}$ is the falling factorial.)

$$g^{(e)}(x) = \frac{\alpha}{0!} + \frac{\alpha(\alpha - 1)}{1!}x + \frac{\alpha(\alpha - 1)(\alpha - 2)}{2!}x^2...$$
$$g^{(e)}(x) = \sum_{n=0}^{\infty} \frac{\alpha!}{(\alpha - n - 1)!n!}$$

9. Let h_n denote the number of ways to color the square of a 1-by-n board with the colors red, white, blue, and green in such a way that the numbers of squares colored red is even and the number of squares colored white is odd. Determine the exponential generating function for the sequence, then find a simple formula for h_n .

Colors: RWBG. R is even, W is odd.

EGF:

$$(1 + \frac{x^2}{2!} + \frac{x^4}{4!}...)(x + \frac{x^3}{3!} + \frac{x^5}{5!}...)(1 + x + \frac{x^2}{2!} + \frac{x^3}{3!}...)^2$$

$$\frac{1}{2}(e^x + e^{-x}) * \frac{1}{2}(e^x - e^{-x}) * e^x * e^x$$

$$\frac{1}{4}(e^{2x} - e^{-2x}) * e^{2x}$$

$$\frac{1}{4}(e^{4x} - 1)$$

$$f(x) = \frac{1}{4}(e^{4x} - 1) \longrightarrow f'(x) = \frac{1}{4}(4e^{4x}) \longrightarrow f''(x) = \frac{1}{4}16e^{4x} \longrightarrow f'''(x) = \frac{1}{4}64e^{4x} \longrightarrow f^n(x) = \frac{1}{4}(4^ne^{4x})$$
So.

 $h_n = \frac{4^n}{4n!}$ Which doesn't seem right since n! grows faster than 4^n . Also, where goes - 1?

10. Determine the number of ways to color the squares of a 1-by-n board using the colors red, blue, green, and orange if an even number of squares is to be colored red and an even number is to be colored green.

Colors: RGBO. R, G are even.

GF:

$$(1+x^2+x^4...)^2(1+x+x^2+x^3...)^2$$

$$\frac{1}{1-x^2}\frac{1}{1-x^2}\frac{1}{1-x}\frac{1}{1-x}$$

$$\frac{1}{(1-x)^4(1+x)^2}$$

$$\frac{A}{(1-x)} + \frac{B}{(1-x)^2} + \frac{C}{(1-x)^3} + \frac{D}{(1-x)^4} + \frac{E}{(1+x)} + \frac{F}{(1+x)^2}$$

$$A\sum x^n + E\sum (-1)^n x^n$$

which is

11. Determine the number of n-digit numbers with all digits odd, such that 1 and 3 each occur a nonzero, even number of times.

$$d_1, d_2... d_n$$
 where $d_i \% 2 = 1$

1 and 3 each occur a nonzero, even number of times. 5, 7, and 9 can occur any amount of times. So:

$$(x^{2} + x^{4} + x^{6}...)^{2}(1 + x + x^{2}...)^{3}$$

$$(\frac{1}{(1-x)^{2}} - 1)^{2}(\frac{1}{1-x})^{3}$$

$$(\frac{1-(1-x)^{2}}{(1-x)^{2}})^{2}(\frac{1}{1-x})^{3}$$

$$(\frac{2x-x^{2}}{(1-x)^{2}})^{2}(\frac{1}{1-x})^{3}$$

$$\frac{(2x-x^{2})^{2}}{(1-x)^{7}}$$

$$\frac{x^{4}-4x^{3}+4x^{2}}{(1-x)^{7}}$$

which decomposes into:

$$\frac{-1}{(x-1)^3} + \frac{2}{(x-1)^5} + \frac{-1}{(x-1)^7}$$
$$-\sum x^{3n} + 2\sum x^{5n} - \sum x^{7n} \longrightarrow \sum -x^{3n} + 2x^{5n} - x^{7n}$$

- 12. Solve the recurrence relation:
 - a. $h_n = 4h_{n-2}$, $h_0 = 0$, $h_1 = 1$, and $n \ge 2$. 0, 1, 0, 4, 0, 16, 0, 64... $h_n - 4h_{n-2} = 0$ $q^{n-2}(q^2 - 4) = 0$ $h_n = a(2)^n + b(-2)^n$ 0 = a + b and 1 = 2a - 2b $b = -\frac{1}{4}$, $a = \frac{1}{4}$ $h_n = \frac{1}{4}2^n - \frac{1}{4}(-2)^n$
 - $h_n = \frac{1}{4}2^n \frac{1}{4}(-2)^n$ b. $h_n = h_{n-1} + 9h_{n-2} 9h_{n-3}$, $h_0 = 0$, $h_1 = 1$, and $h_2 = 2$. $n \ge 3$. $q^{n-3}(q^3 q^2 9q^1 9) = 0$ $(q^2 9)(q^1 + 1) = 0$ (q 3)(q + 3)(q + 1) = 0 $h_n = a(3)^n + b(-3)^n + c(-1)^n$ So, 0 = a + b + c, 1 = 3a 3b c, 2 = 9a + 9b + c Hence, $a = \frac{1}{4}$, b = 0, $c = -\frac{1}{4}$ $h_n = \frac{1}{4}(3)^n + -\frac{1}{4}(-1)^n$
 - c. $h_n = 4h_{n-1} + 4^n$, $h_0 = 3$ and $n \ge 1$. 3, 16, 80, 384...

13. Let h_n = the number of ternary strings of length n made up of 0's, 1's, and 2's, such that the substrings 00, 01, 10, and 11 never occur. Prove that

$$h_n = h_{n-1} + 2h_{n-2}$$

with $h_0 = 1$, $h_1 = 3$, and then find a formula for h_n .

14. Compute the Stirling numbers of the first and second kind up to n=6 using their recursive formulas.

But stirling numbers take 2 parameters: s(p, k); where does n fit?

15. Prove the Stirling numbers of the second kind satisfy:

Recall:
$$S(p, k) = k S(p - 1, k) + S(p - 1, k - 1)$$

- a. S(n, 1) = 1
- b. $S(n, 2) = 2^{n-1} 1$
- c. $S(n, n 1) = \binom{n}{2}$

16. Prove the Stirling numbers of the first kind satisfy:

a.
$$s(n, 1) = (n - 1)!$$

b.
$$s(n, n-1) = \binom{n}{2}$$

17. Write $[n]_{(k)}$ as a polynomial in n for k = 5, 6, 7. (Do not use distribution!)

$$[n]_{(\underline{k})} = n(n-1)(n-2)...(n-k)$$

$$[n]_{(\underline{k})} = \sum_{p=0}^{k} (-1)^{k-p} s(k,p) n^p$$

$$[n]_{(\underline{5})} = \sum_{p=0}^{5} (-1)^{5-p} s(5,p) n^p$$

$$[n]_{(\underline{5})} = -s(5,0) \, + \, s(5,1)n \, - \, s(5,2)n^2 \, + \, s(5,3)n^3 \, - \, s(5,4)n^4 \, + \, s(5,5)n^5$$

$$[n]_{(5)} = 4!n - s(5,2)n^2 + s(5,3)n^3 - {5 \choose 2}n^4 + n^5$$

$$s(5, 2) = 4s(4, 2) + 3!$$
 and $s(5, 3) = 4\binom{4}{2} + s(4, 2)$

18. Find a closed formula for the sequence: 1, 6, 15, 28, 45, 66, 91, ... (Use a difference table.)

$$h_n = 1\binom{n}{0} + 5\binom{n}{1} + 4\binom{n}{2}$$
